

# ROWA® bac M

**ROWA® bac M** was specially developed for improving the micro flora in fresh water and sea water aquaria.

Start-up stages are shortened with new installations and biological equilibrium is stabilized.

Using **ROWA® bac M** instead of inocula from other aquaria avoids the risk of introducing diseases and unwanted microorganisms.

Nitrification and denitrification processes which would otherwise proceed only slowly and to an initially insufficient extent can be observed immediately after utilization of **ROWA® bac M**.

## ***Microorganisms for a biological equilibrium*** for fresh water and sea water aquaria

### **ROWA® bac M ...**

- **reduces ammonium, ammonia, nitrate and nitrite**
- contains exclusively **salt-tolerant nitrifiers and denitrifiers**
- promotes the formation of a stable nitrifier population
- stabilized the **nitrogen cycle**
- **compensates for loss** of biological equilibrium following filter cleaning, water replacement and medicinal treatments
- **ROWA® bac M** microorganisms are **harmless to fish, invertebrates and plants**
